

Main Function Explain

this is a Guess Game , first i add Hint mechanism to help player to guess the word ,the hint process work as follow the available hints is three for each hint the program show one letter for the player , after the hints is empty the Hint choice is unavailable for the user to use ,

for the guessing process , i give for him 5 tries to guess the word if the player use all the tries the game end and he loses,

when i take the input from user , i convert the letters into lower case and trim the spaces and equal the resolved word with input using equals function ,bec it compare the content of the two var but == compare the memory addresses
